

# TOO OLD TO DEMONSTRATE, TO YOUNG TO DIE

MARCEL TAUDE

ABSTRACT. Playing with integer equations is really nice. This paper is a ... hmmm ... demonstration of an old adage *if you don't practice mathematics for a long time, it's hard to come back to it*. Even when listening cool jazz from *Lee Konitz*. At least, I played with  $\text{\LaTeX}$  and *gcc*.

At first, I wanted to find an algorithm to find integers which verify  $a^3 + b^3 + c^3 = 1000^2 \cdot a + 1000 \cdot b + c$  with  $a, b, c \in [0, 1000[$ . There is an obvious lazy algorithm which tries every values of  $a, b$  and  $c$  in the range  $[0, 1000[$ . I wanted a clever one, not sure I found it, but read.

## Contents

### 1. THE PROBLEM

Find all integers which verify :

$$(1) \quad a^3 + b^3 + c^3 = 1000^2 \cdot a + 1000 \cdot b + c, \text{ with } a, b, c \in [0, 1000[$$

We can *easily* find all the integers  $(a, b, c)$  verifying (1) by computing the two members of (1) for every values  $(a, b, c)$  from 0 to 999. Can we find a more clever way to get these values?

We can transform (1) in :

$$(2) \quad \begin{aligned} c^3 - c &= 1000^2 \cdot a + 1000 \cdot b - a^3 - b^3 \\ c(c-1)(c+1) &= a(1000-a)(1000+a) + b(1000-b^2) \end{aligned}$$

It becomes more obvious that the triplets  $(0, 0, 0)$  and  $(0, 0, 1)$  are two solutions of (1).

### 2. ... AND THIS IS THE PLACE WHERE I BECAME MAD

So much time without playing with mathematics makes things harder than I thought. Music helps me to keep cool, some good old jazz played by *Lee Konitz* in the late fifties, and that's all. At least, I am playing with  $\text{\LaTeX}$  and *gcc*...

## 3. REBOOT

We will do it in a lighter way. We started with power 3, bad idea.

$$(3) \quad a^2 + b^2 = 100.a + b \text{ with } a, b \in [0, 100[$$

We can make this transformation :

$$(4) \quad b(b-1) = a(100-a)$$

We can see that the left side of (5) must be even, so  $a$  is even too.

**3.1. the even side.** We begin with the case of  $b$  even :

$$(5) \quad \begin{aligned} a &= 2\alpha \\ b &= 2\beta \\ 2\beta(2\beta-1) &= 2\alpha(100-2\alpha) \\ \beta(2\beta-1) &= 2\alpha(50-\alpha) \end{aligned}$$

If so,  $\beta$  must be even, *i.e.* :

$$(6) \quad \begin{aligned} \beta &= 2\gamma \\ 2\gamma(4\gamma-1) &= 2\alpha(50-\alpha) \\ \gamma(4\gamma-1) &= \alpha(50-\alpha) \end{aligned}$$

The good news is :

$$(7) \quad \begin{aligned} \gamma &\in [0, 25[ \\ \alpha &\in [0, 50[ \\ a &= 2\alpha \\ b &= 4\gamma \end{aligned}$$

We have less couples  $(\alpha, \gamma)$  to test.

**3.2. the odd side.** Now, we are looking at odd values of  $b$ :

$$(8) \quad \begin{aligned} a &= 2\alpha \\ b &= 2\beta + 1 \\ 2\beta(2\beta+1) &= 2\alpha(100-2\alpha) \\ \beta(2\beta+1) &= 2\alpha(50-\alpha) \end{aligned}$$

We come back to the previous case with few changes :

$$(9) \quad \begin{aligned} \gamma &\in [0, 25] \\ \alpha &\in [0, 50[ \\ a &= 2\alpha \\ b &= 4\gamma + 1 \end{aligned}$$

**3.3. ... and now.** It's time to write some code to test all these beautiful formulas.

## 4. NOTES

I wrote this document with L<sup>A</sup>T<sub>E</sub>X, using the AMS packages (*cf.* [AMSIstr2004] and [AMSUsersG2002]). The *href* package (*cf.* [HREFPackage]) gives me the links.
